

Special Features

- High Efficiency, 85% at 1.2 V / 25 A, 90% at 3.3 V / 15 A
- Fast Transient Response
- DOSA standard sixteenth-brick footprint and pin-out configuration
- Low Output Ripple and Noise
- No Minimum Load Required
- Input Stand-by Power <50 mW
- Wide-Trim Adjustable Output Voltage
- Back Bias Start-up $\leq 100\%$ of set point voltage
- Remote Sense
- Remote ON-OFF
- RoHS-6 Compliance (Directive 2002/95/EC)

Applications

- ITC Equipment (IT, Telecommunication, Networking)
- Distributed Power Architecture
- Industrial and Medical Application

Family Description

Roal's 16th Bricks are full featured, energy optimized DC to DC converters completely compatible with DOSA requirements. The unit's design is based on proprietary magnetics construction and utilizes secondary side control. This combination yields a very fast transient response, high operating efficiency and permits a wide output voltage adjustment range.

These converters possess exceptional electrical and thermal performance allowing operation under a wide range of environmental conditions. They also have built in protection against abnormal operating conditions including input under voltage, output overload, output over-voltage, and over-temperature.

Model List

Protection Features

Input Under Voltage	Lockout
Output Over Voltage	With auto-recovery
Output Over Current	
Output Short Circuit	Hiccup mode, auto-recovery
Over Temperature	Thermal Shutdown, auto-recovery

Physical Specification

Case	16 th brick converters are in PTH configuration
Dimensions	33.0 mm x 22.9 mm x 9.50 mm = = 1.30 in x 0.90 in x 0.374 in
Weight	15 gr = 0.033 lb

Control Features _ All versions

Output Voltage Adjustment

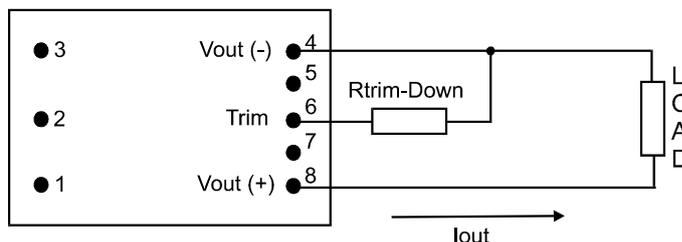

The trim input permits the user to adjust the output voltage across the sense leads up or down according to the trim range specifications.

To decrease the output voltage the user should connect a resistor between Pin6 (Trim) and Pin4 (Vout (-)). For a desired decrease of the nominal output voltage the value of the resistor should be :

$$R_{\text{trim-down}} = \left(\frac{511}{\Delta\%} \right) \cdot 10.22 \text{ (k}\Omega\text{)}$$

where

$$\Delta\% = \left(\frac{V_{\text{nominal}} - V_{\text{desired}}}{V_{\text{nominal}}} \right) \times 100\%$$

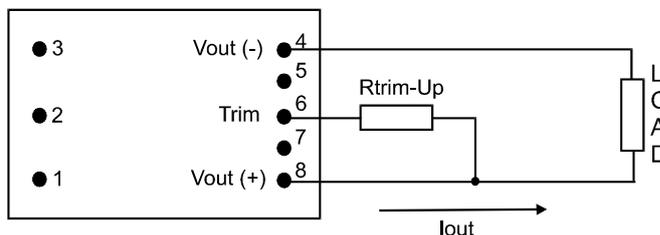

To increase the output voltage the user should connect a resistor between Pin6 (Trim) and Pin8 (Vout(+)). For a desired increase of the nominal output voltage the value of the resistor should be:

$$R_{\text{trim-up}} = \left(\frac{5.11V_{\text{OUT}}(100+\Delta\%)}{1.225\Delta\%} - \frac{511}{\Delta\%} - 10.22 \right) \text{ (k}\Omega\text{)}$$

where

$$V_{\text{OUT}} = \text{Nominal Output Voltage}$$

Note: The Trim feature does not affect the voltage at which the output over-voltage circuit is triggered. Trimming the output voltage too high may cause the over-voltage protection circuit to engage, particularly during transients. It is not necessary for the user to add capacitance at the Trim pin. The node is internally bypassed to eliminate noise.

Control Features _ All versions

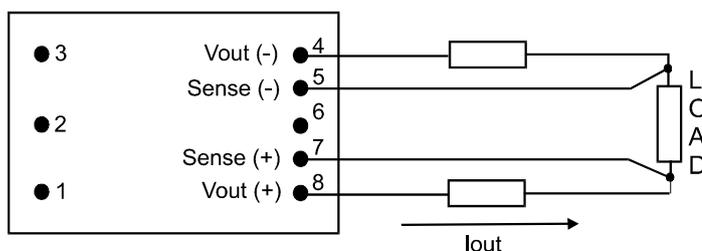

Remote Sense

Remote sense minimizes the effects of distribution losses by regulating the voltage at the remote sense connections. Pin 7 (Sense(+)) should be connected to Vout(+) and Pin5 (Sense(-)) should be connected to Vout(-) at the point on the board where regulation is desired.

The voltage between the remote-sense pins and the output terminals must not exceed the output voltage sense range: $\leq 0.5V$.

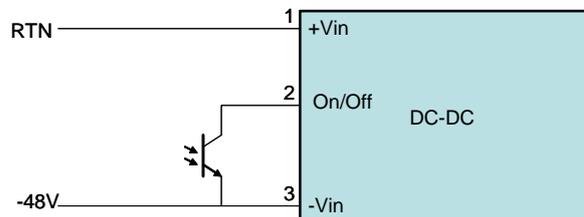

If not using the remote-sense feature to regulate the output voltage at the point of load, connect Sense(+) to Vout(+) and Sense(-) to Vout(-) at the module.

Note: The output over voltage protection circuit senses the voltage across the output (Pins8 and 4) to determine when it should trigger, not the voltage across the converter's sense leads (pins 7 and 5). Therefore the resistive drop on the board should be small enough so that output over voltage protection does not trigger, even during load transients.

Remote On/Off Control

The module is equipped with a Remote On/Off input (pin 2). The module is enabled whenever this input is connected to $-V_{in}$. This can be accomplished by using a transistor or opto-coupler as depicted in the schematic below.
